BioTech-Chem Library Search Results Feedback Form (Optional)

The search results generated for your recent request are attached. If you have any questions or commer (compliments or complaints) about the scope or the results of the search, please contact the RioTech-C searcher who conducted the search or contact:

Mary Hale, Supervisor, 308-4. CM-1 Room 1E01

	I am an examiner in Workgroup: (Example: 1610)
>	Relevant prior art found, search results used as follows:
	102 rejection
	103 rejection
	☐ Cited as being of interest.
	Helped examiner better understand the invention.
	Helped examiner better understand the state of the art in their technology.
	Types of relevant prior art found:
	Foreign Patent(s)
	Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)
۶	Relevant prior art not found:
	Results verified the lack of relevant prior art (helped determine patentability).
	Search results were not useful in determining patentability or understanding the invent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   adipocyte plasma membranes). In vivo it increases metabolism of fat and may stimulate protein (muscle) synthesis. (1) is used: to treat obesity (particularly in subjects at high risk of developing type II diabetes) or to reduce body weight; to stimulate muscle development; as diagnostic marker for cachexia-inducing tumors; to identify or investigate agents that inhibit lipolysis (potential anticachectic or antitumor agents) and to raise specific antibodies (Ab). The Ab are used: for diagnostic detection of (I); as inhibitor or antigonist for treatment of cachexia-inducing cancers and/or tumors, and for affinity purification of (I). (I) induces a loss in body weight by specific deletion of fat; i.e. it does not reduce muscle mass. The present sequence represents the complete amino acid sequence of the human plasma Zn-alpha2-glycoprotein, as published by T. Araki et al. (1988).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nontropic; vasotropic; antipsoriatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating of ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activation or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease a bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 AAC78457 and AAB4420 represent sequences used in the exemplification cancers.

                                                                                                                                                                                                                                                                                                                       The coding sequences and proteins of the present invention are useful for CC preventing, treating or ameliorating a medical condition; and for the CC diagnosis and treatment of diseases and disorders. Diseases and disorders CC that can be diagnosed and treated include (auto)immune diseases (e.g. CC graft versus host disease and rheumatoid arthritis), inflammatory and CC allergic disorders (e.g. asthma), hyperproliferative disorders (e.g. CC cancers and leukemias), cardiovascular disorders (e.g. heart attacks and CC arrythmias), cerebrovascular disorders (e.g. stroke), arterial occlusive CC disorders (e.g. arteriosclerosis), angliogenesis related disorders (e.g. cetinopathy and keloid scares), ocular disorders (e.g. glaucoma), CC neurological disorders (e.g. Alzheimer's, Parkinson's disease, epilepsy CC and Creutzfeld-Jakob disease) and infections caused by bacteria, fungi, CC viruses or parasites. They may also be useful for wound healing, CC regeneration, birth control and as a food additive or preservative.
                                                                                                                                                                                                                                      Query Match

                                                                                                   This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or amount of expression of the new polypeptides in a sample or by determining the presence or absence of mutations in the new polynucleotides. Specific uses are absence of mutations in the new polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative.
                      disorders, developmental abnormalities and foetal deficiencies, disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, a

      The concensus sequence is derived from a total of 23 HLA-A,B,C seq The protein sequences in the three extrecellular domains (alpha-1, alpha-2 and alpha-3) are shown. The example concerned the effect peptides from different HLA-A2 epitopes on cytolysis of target cel CTL of different specificities.

```

The present invention describes a recombinant DNA molecule (I) containing a sequence (Ia) that encodes an altered MHC (major histocompatibility complex) Islas I determinant (II) comprises polypeptide with alphal, alpha2, alpha3 and beta2-microglobulin domains, in which alpha3 and beta2 are covalently linked, thorous and N-termini respectively, via a nucleotide spacer sequence enc

the antigen are associated they are recognized by a mammalian T cell CC receptor (TCR). (I) are used to produce (II) which are used to study functional interactions between the various MHC domains. They can also be used to modulate (in vivo or in vitro) the immune system by inducing CC an effector response (cytotoxicity, antibody synthesis, phagocytosis) CC of immune system cells, typically for treating, or immunising against; CC cancer, acquired immune deficiency syndrome, lupus erythematosus, CC multiple sclerosis, toxic shock and snake bite, but also for selective destruction of autoreactive cells, diagnostically to assay T cell CC receptors and to raise specific antibodies (useful for diagnosis, purification), AAZ57558 and AAY68186 to AAY68316 are sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     р,

XX

The present invention describes a composition capable of eliciting
CC anti-major histocompatibility (MHC) antibodies. The composition
CC comprises an antigen associated with an altered MHC Class II determinant
CC (I) comprising alphal, alpha2, beta1 and beta2 polypeptide domains
CC encoded by a mammalian MHC Class II locus covalently linked to form a
CC (I) comprises an antigen estain alpha2, alpha1 and beta1 domains in
CC encoded by a mammalian MHC Class II locus covalently linked to form a
CC oplypeptide (I) containing beta2, alpha2, alpha1 and beta1 domains in
CC exequence. The resulting Antigen-MHC complex is recognizable by the T cell
CC receptor. The compositions are used for immunisation against, or
CC deficiency syndrome (AIDS), lupus erythematosus, multiple sclerosis,
CC thyroiditis, toxic shock, tumour and snakebite, depending on the nature
CC of antigen. (I) is also used to analyse functional interactions between
CC the various domains and for targeting lymphocyte receptors. Antibodies
CC against (I) are produced by usual methods of immunisation or cell fusion,
CC and may be humanised by standard methods. These antibodies are useful for
CC and may be humanised by standard methods. These antibodies are useful for
CC compositions and for targeting lymphocyte receptors. Antibodies
CC and may be humanised by standard methods of immunisation or cell fusion,
CC and may be humanised by standard methods of immunisation are useful for
CC and may be humanised by a standard methods of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a major histocompatibility complex (MHC) class I determinant, which has alpha_1 alpha_2 alpha_3 and beta2-microglobulin polypeptide domains encoded by a mammalian MHC class I locus. The MHC class I determinants are useful for activating the immune system and presenting antigens to the immune system to elicit an antigenic response. The MHC class I determinants are also useful for treating diseases, e.g. T cell mediated autoimmune disease, AIDS, lupus erythematosus, toxic shock or snake bite. The altered MHC class I determinants and compositions containing antigens bound to the determinants are useful in diagnostic applications, e.g. altered determinants may be used to target lymphocyte receptors and the resulting bound determinant can be assayed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New altered major histocompatibility complex (MHC) class I determinant useful for eliciting an immune response and/or for immunizing against or treating diseases, for example, multiple sclerosis, AIDS, toxic shock or snake bite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-JAN-1995;

                                                                                                                                                                                                                                                                                                                                                                                              measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The

The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at from int/mih/mih/shad not segmence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system which may enable the diagnosis and improved treatment of nervous system.
                                                                                                                                                                                                                microarray;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       epilepsy and cancers. The present sequence is a the probes of the invention.

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancer such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             see AAI31315-AAI57546). The present sequence is a peptide encoded by such probe. The probes are useful for producing a microarray for preducting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614

Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency t nucleic acid expressed in the human lung; measuring gene expression sample derived from human lung, comprising (a) contacting the array a collection of detectably labeled nucleic acids derived from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed encoded that the protein have the sequence data for this patent did not form part.
                                                                                                                                                                                                                                                                                                                            Human; vaccination; gene therapy; nutritional supplement; stem cell proliferation; haematopoiesis; nerve tissue regeneration; immune suppression; immune stimulation; anti-inflammatory; leukaemi

                                                                                                                                                                                                                                                                                                                                     Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel human secreted polypeptides. The CC polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated CC with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cclls expressing the proteins are useful for identifying a therapeutic agent CC for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising CC the nucleic acids encoding the polypeptides and cells genetically cengineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and CC therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in CC bone, cartilage, tendon and/or stimulation; as anti-inflammatory agents; and CC in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid CC sequences of novel human secreted proteins of the invention.
